

Cost Engineering Academy

Knowledge and experience are at the centre of what we do as cost engineers. At Cost Engineering we are very much aware of this. As cost engineering is the art of assigning value to that which has been or will be engineered, this is an art that needs both knowledge and practice. At Cost Engineering we have been practicing and perfecting this art for over 30 years. The Cost Engineering Academy is all about putting that knowledge and experience into your hands.

The Cost Engineering Academy has compiled a well chosen and finely tuned set of courses for you to enjoy. Whether you are looking for background knowledge on cost engineering to support your management position, more knowledge on how to use your cost engineering tools, or whether you are looking to become a certified cost engineer, the Cost Engineering Academy has the courses to suit your needs.

“Putting knowledge to work”

Individual attention

In the thirty years that we have been active in Cost Engineering, we have learned that cost engineering is a very diverse art. But like painting, regardless of whether your style is realism or abstract, the basic techniques are always the same. Cost Engineering has adapted the same approach to the Cost Engineering Academy. By keeping the groups small, attention can be given to the specific situations you are facing in your organization. Through this individual approach to teaching, participants of the Cost Engineering Academy are always sure to finish a course with knowledge that adds value to their everyday projects.

Cost engineering courses

At the core of the Cost Engineering Academy are courses on estimating, cost control, and other cost engineering subjects. The subjects for the courses of the Cost Engineering Academy have been carefully selected to build on one another. That way you know that a course at the Cost Engineering Academy is always a step towards your future. Whether you need to gain a basic understanding of cost engineering to benefit your project, or if you are an experienced estimator in search of an in depth course in specific approaches to cost engineering, the Cost Engineering Academy has a great course for you.

Software training

Software now is one of the most valuable tools of the cost engineering trade. This is the reason why Cost Engineering has been involved in the development of cost engineering tools since we started. However, the knowledge of a tool determines the value of the

outcome. For this reason, the Cost Engineering Academy offers a number of courses to make sure that you make the most of the tools you have available. These courses have been divided up to suit all types of users. And again, by keeping the groups small, you will know that the Cost Engineering Academy will pay full attention to the knowledge you need for your situation.

In-house

The Cost Engineering Academy offers its courses as public courses. The benefit of this is that you can learn from people from other organizations and fields. However, the Cost Engineering Academy acknowledges that sometimes it is better to challenge a group of people within your organization. Through careful assessment of one of our consultants, the Cost Engineering Academy can determine the exact needs for your organization. By catering for that need, the Cost Engineering Academy makes sure that your organization gains the knowledge it needs. As cases will be based on your own projects, there is no gap between practice and the day to day reality of your organization.

Added value

The Cost Engineering Academy is not just about courses. We are not even just about sharing knowledge. The Cost Engineering Academy is about building your knowledge and abilities so that you can add even more value to your organization. By being a great cost engineer.
